Digital Signal Processing: Pearson New International

The most common processing approach in the time or space domain is enhancement of the input signal through a method called filtering. Digital filtering generally consists of some linear transformation of a number of surrounding samples around the current sample of the input or output signal. There are various ways to characterize filters; for example:

In digital signal processing, decimation is the process of reducing the sampling rate of a signal. The term downsampling usually refers to one step of the process, but sometimes the terms are used interchangeably. Complementary to upsampling, which increases sampling rate, decimation is a specific case of sample rate conversion in a multi-rate digital signal processing system.
