AP Chemistry Lab #13 Page 1 of 8. Lab #13: Qualitative Analysis of Cations and Anions Objectives: 1. To understand the rationale and the procedure behind the separation for various cations and anions.

### **Lab 13 Qualitative Analysis of Cations and Anions**

Other metal ions (such as  $\text{Pb}^{2+}$ ,  $\text{Cu}^{2+}$ ,  $\text{Al}^{3+}$  and  $\text{Zn}^{2+}$ ) will test only weakly acidic ( $3 < \text{pH} < 6$ ). When a substance dissolves in water and causes an increase in the concentration of hydroxide ions ( $\text{OH}^-$ ), the substance is considered to be a base.

The luminescence of a class of bismuth heterocycles, termed bismoles, was studied via ultrafast laser spectroscopy in conjunction with TD-DFT computations to determine why phosphorescence is observed for some bismoles but not others.

Polarography is a type of voltammetry where the working electrode is a dropping mercury electrode (DME) or a static mercury drop electrode (SMDE), which are useful for their wide cathodic ranges and renewable surfaces. It was invented in 1922 by Czech chemist Jaroslav Heyrovský, for which he won the Nobel prize in 1959.

Chromatography is a laboratory technique for the separation of a mixture. The mixture is dissolved in a fluid  
called the mobile phase, which carries it through a structure holding another material called the stationary  
phase. The various constituents of the mixture travel at different speeds, causing them to separate.
